Module 2 > Investigate packet details

Previous Next >

Investigate packet details

So far, you've learned about how network protocol analyzers (packet sniffers) intercept network communications. You've also learned how you can analyze packet captures (p-caps) to gain insight into the activity happening on a

network. As a security analyst, you'll use your packet analysis skills to inspect network packets and identify suspicious activity during investigations. In this reading, you'll re-examine IPv4 and IPv6 headers. Then, you'll explore how you can use Wireshark to

Packets form the foundation of data exchange over a network, which means that detection begins at the packet level. The Internet Protocol (IP) includes a set of standards used for routing and addressing data packets as they

travel between devices on a network. IP operates as the foundation for all communications over the internet.

investigate the details of packet capture files. Internet Protocol (IP)

IP ensures that packets reach their destinations. There are two versions of IP that you will find in use today: IPv4 and

destination.

IPv6

source.

human-readable format.

you can find what you need.

IPv6. Both versions use different headers to structure packet information. IPv4 IPv4 is the most commonly used version of IP. There are thirteen fields in the header:

Internet Header Length (IHL): This field specifies the length of the IPv4 header including any Options.

Total Length: This field specifies the total length of the entire IP packet including the header and the data. Identification: Packets that are too large to send are fragmented into smaller pieces. This field specifies a

Type of Service (ToS): This field provides information about packet priority for delivery.

Version: This field indicates the IP version. For an IPv4 header, IPv4 is used.

Flags: This field provides information about packet fragmentation including whether the original packet has been fragmented and if there are more fragments in transit.

unique identifier for fragments of an original IP packet so that they can be reassembled once they reach their

Fragment Offset: This field is used to identify the correct sequence of fragments.

Protocol: This field specifies the protocol used for the data portion of the packet.

- Time to Live (TTL): This field limits how long a packet can be circulated in a network, preventing packets from being forwarded by routers indefinitely.
- Header Checksum: This field specifies a checksum value which is used for error-checking the header.
- **Destination Address**: This field specifies the destination address of the receiver.
- **Options**: This field is optional and can be used to apply security options to a packet.
- Fragment Offset

Options

IPv6 adoption has been increasing because of its large address space. There are eight fields in the header:

Version: This field indicates the IP version. For an IPv6 header, IPv6 is used.

Payload Length: This field specifies the length of the data portion of the packet.

about the packet's priority or class to help with packet delivery.

- Source Address
- Next Header: This field indicates the type of header that follows the IPv6 header such as TCP. Hop Limit: This field is similar to the IPv4 Time to Live field. The Hop Limit limits how long a packet can travel in a network before being discarded. Source Address: This field specifies the source address of the sender. Destination Address: This field specifies the destination address of the receiver.

Traffic Class: This field is similar to the IPv4 Type of Service field. The Traffic Class field provides information

Flow Label: This field identifies the packets of a flow. A flow is the sequence of packets sent from a specific

Wireshark Wireshark is an open-source network protocol analyzer. It uses a graphical user interface (GUI), which makes it easier to visualize network communications for packet analysis purposes. Wireshark has many features to explore that are beyond the scope of this course. You'll focus on how to use basic filtering to isolate network packets so that

Display filters Wireshark's display filters let you apply filters to packet capture files. This is helpful when you are inspecting packet captures with large volumes of information. Display filters will help you find specific information that's most relevant to your investigation. You can filter packets based on information such as protocols, IP addresses, ports, and virtually any other property found in a packet. Here, you'll focus on display filtering syntax and filtering for protocols, IP addresses, and ports. Comparison operators

arp telnet icmp For example, if you would like to filter packets that contain a specific IP address use ip.addr, followed by a space, the equal == comparison operator, and the IP address. Here is an example of a display filter that filters for the IP address 172.21.224.2:

To filter for packets originating from a specific source IP address, you can use the ip.src filter. Here is an example

To filter for packets delivered to a specific destination IP address, you can use the ip.dst filter. Here is an example

You can also filter packets according to the Media Access Control (MAC) address. As a refresher, a MAC address is a

tcp.port == 25 Follow streams

unique alphanumeric identifier that is assigned to each physical device on a network.

X-XSS-Protection: 0

transferred in the stream in a way that's simple to read.

■ Wireshark · Follow TCP Stream (tcp.stream eq 4) · sample.pcap

Following a protocol stream is useful when trying to understand the details of a conversation. For example, you can examine the details of an HTTP conversation to view the content of the exchanged request and response messages. Key takeaways In this reading, you explored basic display filters with Wireshark. Packet analysis is an essential skill that you will continue to develop over time in your cybersecurity journey. Put your skills to practice in the upcoming activity and

Report an issue

Source Address: This field specifies the source address of the sender.

Header fields contain valuable information for investigations and tools like Wireshark help to display these fields in a

You can use different comparison operators to locate specific header fields and values. Comparison operators can be

Symbol

!=

Abbreviation

eq

ne

expressed using either abbreviations or symbols. For example, this filter using the == equal symbol in this filter

ip.src == 8.8.8.8 is identical to using the eq abbreviation in this filter ip.src eq 8.8.8.8.

This table summarizes the different types of comparison operators you can use for display filtering.

> Greater than gt Less than < lt Greater than or equal to >= ge Less than or equal to <= le Pro tip: You can combine comparison operators with Boolean logical operators like and and or to create complex display filters. Parentheses can also be used to group expressions and to prioritize search terms. Contains operator The **contains** operator is used to filter packets that contain an exact match of a string of text. Here is an example of a filter that displays all HTTP streams that match the keyword "moved". • • • sample.pcap File Edit View Go Capture Analyze Statistics Telephony Wireless Tools Help 🛾 🔳 🔬 📵 📙 🖺 🗶 🚨 🤇 👄 👄 🕮 ቸ 赴 🕎 🗏 @ @ @ 题 http contains "moved"

expression is a sequence of characters that forms a pattern. You'll explore more about regular expressions later in this program. Filter toolbar You can apply filters to a packet capture using Wireshark's filter toolbar. In this example, dns is the applied filter, which means Wireshark will only display packets containing the DNS protocol.

The matches operator is used to filter packets based on the regular expression (regex) that's specified. Regular

Filter for an IP address You can use display filters to locate packets with a specific IP address.

Filter for ports Port filtering is used to filter packets based on port numbers. This is helpful when you want to isolate specific types of traffic. DNS traffic uses TCP or UDP port 53 so this will list traffic related to DNS queries and responses only. For example, if you would like to filter for a UDP port: udp.port == 53 Likewise, you can filter for TCP ports as well:

Wireshark provides a feature that lets you filter for packets specific to a protocol and view streams. A stream or conversation is the exchange of data between devices using a protocol. Wireshark reassembles the data that was
